

## Front Brake Shield Modifications

- Trim shield to clear caliper as shown in pictures – Template is included with the kit.
- The upper raised rectangular area can be modified by bending the shield toward the strut until it has clearance from the rotor.
- The Lower raised area can be cut out to remove the raised area, or it can be “bodyworked” to reshape. There is not enough room between the rotor and strut to just bend out of the way as can be done for the upper area.
